

bearerCORE™

Full Privacy Framework

Prepared for: TowerPoint Group Ltd.

Platform: bearerCORE™

Version: 1.0

Effective: January 2026

Jurisdiction: Republic of Ghana · African Union · GDPR-aligned

1

Data Sovereignty & Minimization

TowerPoint Group operates on a "Privacy by Design" principle. bearerCORE™ is engineered to minimize the collection of Personally Identifiable Information (PII). We do not track individual spending habits; we provide the infrastructure for secure, sovereign value transfer.

1.1 Data Minimization Commitment

The bearerCORE™ platform collects only the minimum data necessary to fulfill its infrastructure function. No behavioral profiles, spending analytics, or individual transaction histories are stored, aggregated, or shared by TowerPoint Group in any form.

1.2 Sovereign Data Responsibility

Each sovereign entity (Central Bank or designated authority) retains full ownership and control of all transaction data processed through the platform. TowerPoint Group acts solely as the technical conduit; all data residency, retention, and governance obligations remain with the sovereign entity.

- Data residency requirements are determined solely by the sovereign entity.
- Retention obligations are governed by the laws of the participating jurisdiction.
- Lawful interception compliance remains the responsibility of the issuing Central Bank.
- National cybersecurity requirements are implemented at the sovereign layer.

2

Cryptographic Security

All data transmitted through the bearerCORE™ gateway is secured using AES-256-GCM encryption and authenticated via Ed25519 digital signatures. This ensures that only authorized entities — as defined by the issuing Central Bank — can validate transaction data.

2.1 Encryption Standards

- AES-256-GCM: Symmetric encryption for all data in transit and at rest within the platform gateway.
- Ed25519: Asymmetric digital signature scheme used for issuer authentication and transaction integrity verification.
- Zero-log session architecture: No session credentials or authentication tokens are persisted beyond the active session.

2.2 Key Management

TowerPoint Group does not hold, generate, or have access to private keys on behalf of any user or institution. Key custody is maintained exclusively by the participating Central Bank and the authorized end-user.

TowerPoint Group operates a zero-knowledge architecture with respect to private keys. We have no technical capacity to recover, reset, or access credentials held by any participant.

3

Regional & International Compliance

bearerCORE™ is designed to operate in alignment with applicable data protection frameworks across its target jurisdictions. Compliance is layered across three tiers: national, pan-African, and international.

3.1 Ghana — National Framework

Data Protection Act, 2012 (Act 843). All data processing activities within Ghana are conducted in accordance with the principles of this Act, including lawful processing, data minimization, purpose limitation, and the rights of data subjects.

3.2 Pan-African Framework

The African Union Malabo Convention (2014) on Cyber Security and Personal Data Protection. bearerCORE™ infrastructure is architected to support cross-border deployments consistent with AU member state obligations under this Convention.

3.3 International Alignment

Alignment with GDPR principles regarding data portability and the Right to be Forgotten, where applicable to immutable ledger constraints. Where ledger immutability creates an irreconcilable conflict with erasure obligations, TowerPoint Group will work with the sovereign entity to implement pseudonymization or access-restriction remedies.

3.4 Compliance Frameworks Referenced

- GDPR (EU) — data portability, right to erasure (where technically feasible).
- AU Malabo Convention (2014) — pan-African cyber security and personal data.
- Ghana Data Protection Act, 2012 (Act 843) — primary national framework.
- FATF Guidance — AML/CFT obligations at the sovereign layer.
- ISO 27001 — information security management alignment.
- NIST Cybersecurity Framework — infrastructure security posture.

4

Non-Custodial Infrastructure

TowerPoint Group does not hold, manage, or have access to private keys or "digital money" on behalf of users. Access is managed solely by the participating Central Bank and the end-user.

4.1 Non-Custodial Commitment

The bearerCORE™ platform is architected as non-custodial infrastructure. TowerPoint Group does not:

- Hold customer funds or sovereign reserves.
- Control or store private keys for any participant.
- Custody digital assets on behalf of any user or institution.
- Manage end-user wallets, unless explicitly agreed by separate written agreement with the relevant Central Bank.
- Operate as a deposit-taking institution, money transmitter, or financial intermediary.

4.2 User Responsibility

The security and custody of digital wallets and access credentials is the sole responsibility of the user, analogous to the physical custody of cash. TowerPoint Group provides the infrastructure rails; the user governs access to their own holdings.

END OF DOCUMENT

This document constitutes the full Privacy Framework for the bearerCORE™ platform. Questions or institutional enquiries should be directed to TowerPoint Group Ltd. via the Protocol Desk at bearercore.com/protocol-desk.
